

Nuxt Config File

Nuxt can be easily configured with a single `nuxt.config` file, which can have either a `.js`, `.ts` or `.mjs` extension.

```
export default defineNuxtConfig({  
  // My Nuxt config  
})
```

`defineNuxtConfig` [helper is globally available without import.](#)

You can explicitly import `defineNuxtConfig` from `nuxt/config` if you prefer:

```
import { defineNuxtConfig } from 'nuxt/config'  
  
export default defineNuxtConfig({  
  // My Nuxt config  
})
```

To ensure your configuration is up to date, Nuxt will make a full restart when detecting changes in the main configuration file, the `.env`, `.nuxtignore` and `.nuxtrc` dotfiles.
