

# <Teleport>

The `<Teleport>` component teleports a component to a different location in the DOM.

The `to` target of `<Teleport>` expects a CSS selector string or an actual DOM node. Nuxt currently has SSR support for teleports to `body` only, with client-side support for other targets using a `<ClientOnly>` wrapper.

## Example: `body` Teleport

```
<template>
  <button @click="open = true">
    Open Modal
  </button>
  <Teleport to="body">
    <div v-if="open" class="modal">
      <p>Hello from the modal!</p>
      <button @click="open = false">
        Close
      </button>
    </div>
  </Teleport>
</template>
```

## Example: Client-side Teleport

```
<template>
```

```
<ClientOnly>
  <Teleport to="#some-selector">
    <!-- content -->
  </Teleport>
</ClientOnly>
</template>
```
