Nuxt Kit

Nuxt Kit provides composable utilities to make interacting with Nuxt Hooks and Nuxt Builder Core and developing Nuxt Modules super easy!

Usage

Install Dependency

You can install the latest Nuxt Kit by adding it to the `dependencies` section of your `package.json`. However, please consider always explicitly installing the `@nuxt/kit` package even if it is already installed by Nuxt.

```
{  
  "dependencies": {  
    "@nuxt/kit": "npm:@nuxt/kit-edge@latest"  
  }  
}
```

package.json

Import Kit Utilities

```
import { useNuxt } from '@nuxt/kit'
```

test.mjs

 [Read more in API > Advanced > Kit.](#)

Nuxt Kit utilities are only available for modules and not meant to be imported in runtime (components, Vue composables, pages, plugins, or server routes).

Nuxt Kit is an esm-only package meaning that you **cannot** `require('@nuxt/kit')`. As a workaround, use dynamic import in the CommonJS context:

```
// This does NOT work!  
// const kit = require('@nuxt/kit')  
async function main() {  
  const kit = await import('@nuxt/kit')  
}  
main()
```
