# nuxi typecheck

```
npx nuxi typecheck [--log-level] [rootDir]
```

The `typecheck` command runs `vue-tsc` to check types throughout your app.

| Option               | Default        | Description                              |
|----------------------|----------------|--|
| <code>rootDir</code> | <code>.</code> | The directory of the target application. |

This command sets `process.env.NODE_ENV` to `production`. To override, define `NODE_ENV` in a `.env` file or as a command-line argument.

You can also enable type-checking at build or development time by installing `typescript` and `vue-tsc` as `devDependencies` and enabling the `typescript.typeCheck` option in your `nuxt.config` file.
