

Using App Router
 Features available in /app

Getting Started > Installation

Installation

System Requirements:

- [Node.js 16.14](#) or later.
- macOS, Windows (including WSL), and Linux are supported.

Automatic Installation

We recommend starting a new Next.js app using `create-next-app`, which sets up everything automatically for you. To create a project, run:

>_ Terminal

```
npx create-next-app@latest
```

On installation, you'll see the following prompts:

>_ Terminal

```

1  What is your project named? my-app
2  Would you like to use TypeScript? No / Yes
3  Would you like to use ESLint? No / Yes
4  Would you like to use Tailwind CSS? No / Yes
5  Would you like to use `src/` directory? No / Yes
6  Would you like to use App Router? (recommended) No
7  Would you like to customize the default import alias?
8  What import alias would you like configured? @/*
  
```

Fast Refresh

After the prompts, `create-next-app` will create a folder with your project name and install the required dependencies.

Good to know:

- Next.js now ships with [TypeScript](#), [ESLint](#), and [Tailwind CSS](#) configuration by default.
- You can optionally use a `src` directory in the root of your project to separate your application's code from configuration files.

Manual Installation

To manually create a new Next.js app, install the required packages:

>_ Terminal

```
npm install next@latest react@latest react-dom@latest
```

Open your `package.json` file and add the following `scripts`:

 package.json

```
1  {
2    "scripts": {
3      "dev": "next dev",
4      "build": "next build",
5      "start": "next start",
6      "lint": "next lint"
7    }
8  }
```

These scripts refer to the different stages of developing an application:

- `dev`: runs `next dev` to start Next.js in development mode.

- `build`: runs `next build` to build the application for production usage.
- `start`: runs `next start` to start a Next.js production server.
- `lint`: runs `next lint` to set up Next.js' built-in ESLint configuration.

Creating directories

Next.js uses file-system routing, which means the routes in your application are determined by how you structure your files.

The `app` directory

For new applications, we recommend using the [App Router](#). This router allows you to use React's latest features and is an evolution of the [Pages Router](#) based on community feedback.

Create an `app/` folder, then add a `layout.tsx` and `page.tsx` file. These will be rendered when the user visits the root of your application (`/`).

Create a [root layout](#) inside `app/layout.tsx` with the required `<html>` and `<body>` tags:

TS `app/layout.tsx`

```
1 export default function RootLayout({
2   children,
3 }: {
4   children: React.ReactNode
5 }) {
6   return (
7     <html lang="en">
8       <body>{children}</body>
9     </html>
```

```
10    )  
11  }
```

Finally, create a home page `app/page.tsx` with some initial content:

`TS` `app/page.tsx`

```
1  export default function Page() {  
2    return <h1>Hello, Next.js!</h1>  
3  }
```

Good to know: If you forget to create `layout.tsx`, Next.js will automatically create this file when running the development server with `next dev`.

Learn more about [using the App Router](#).

The `pages` directory (optional)

If you prefer to use the Pages Router instead of the App Router, you can create a `pages/` directory at the root of your project.

Then, add an `index.tsx` file inside your `pages` folder. This will be your home page (`/`):

`TS` `pages/index.tsx`

```
1  export default function Page() {  
2    return <h1>Hello, Next.js!</h1>  
3  }
```

Next, add an `_app.tsx` file inside `pages/` to define the global layout. Learn more about the [custom App file](#).

`TS` `pages/_app.tsx`

```
1  import type { AppProps } from 'next/app'  
2
```

```
3   export default function App({ Component, pageProps
4     return <Component {...pageProps} />
5   }
```

Finally, add a `_document.tsx` file inside `pages/` to control the initial response from the server. Learn more about the [custom Document file](#).

```
TS pages/_document.tsx

1   import { Html, Head, Main, NextScript } from 'next',
2
3   export default function Document() {
4     return (
5       <Html>
6         <Head />
7         <body>
8           <Main />
9           <NextScript />
10        </body>
11      </Html>
12    )
13  }
```

Learn more about [using the Pages Router](#).

Good to know: Although you can use both routers in the same project, routes in `app` will be prioritized over `pages`. We recommend using only one router in your new project to avoid confusion.

The `public` folder (optional)

Create a `public` folder to store static assets such as images, fonts, etc. Files inside `public` directory can then be referenced by your code starting from the base URL (`/`).

Run the Development Server

1. Run `npm run dev` to start the development server.

2. Visit `http://localhost:3000` to view your application.
3. Edit `app/layout.tsx` (or `pages/index.tsx`) file and save it to see the updated result in your browser.
