Nuxt ▾
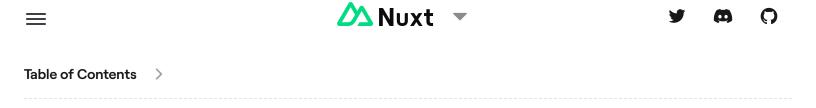

App file

The `app.vue` file is the main component in your Nuxt 3 applications.

Minimal usage

With Nuxt 3, the `pages/` directory is optional. If not present, Nuxt won't include **vue-router** dependency. This is useful when working on a landing page or an application that does not need routing.

```vue
app.vue
<template>
  <h1>Hello World!</h1>
</template>
```

Usage With Pages

If you have a `pages/` directory, to display the current page, use the `<NuxtPage>` component:

```vue
app.vue
<template>
  <div>
    <NuxtLayout>
      <NuxtPage/>
    </NuxtLayout>
  </div>
</template>
```

Since `<NuxtPage>` internally uses the `<Suspense>` component, `<NuxtPage>` cannot be set as a root element.

Remember that `app.vue` acts as the main component of your Nuxt application. Anything you add to it (JS and CSS) will be global and included in every page.

If you want to have the possibility to customize the structure around the page between pages, check out the `layouts/` directory.
