nuxi build

```
npx nuxi build [--prerender] [--dotenv] [--log-level] [rootDir]
```

The `build` command creates a `.output` directory with all your application, server and dependencies ready for production.

Option	Default	Description
rootDir	.	The root directory of the application to bundle.
--prerender	false	Pre-render every route of your application. (**note:** This is an experimental flag. The behavior might be changed.)
--dotenv	.	Point to another `.env` file to load, **relative** to the root directory.

This command sets `process.env.NODE_ENV` to `production`.
